Project Report 2

Build Your Student Digital Portfolio

For this project, I created profiles on Kaggle, LinkedIn, and GitHub to build a strong and professional online presence. Each platform serves a different purpose and will help me in my academic and career journey over the next four years.

LinkedIn is mainly used for professional networking, building connections with classmates, teachers, seniors, and recruiters, and showcasing my education, skills, achievements, and certifications.

GitHub is used to store, manage, and share coding projects, making it useful for building a technical portfolio and showing practical programming work.

Kaggle is a platform mainly used for data science, machine learning, coding practice, datasets, notebooks, and competitions, which helps in improving analytical and technical skills.

Over the next four years, I plan to use **LinkedIn** to maintain a professional profile, connect with industry professionals, and share academic achievements, internships, and certifications. I will use **GitHub** to regularly upload coding projects, assignments, and mini-projects to strengthen my portfolio. I will use **Kaggle** to practice Python, data analysis, and machine learning through notebooks, datasets, and competitions. Together, these platforms will help me improve my skills, build credibility, and prepare for internships and future job opportunities.
